**Problem statement**

Continuing the Gym Membership application, you must manage user sessions by implementing the Remember Me functionality. Make changes in the project accordingly.

**Tasks:-**

1. Create a new LoginController class with a "/login" API through which user logins. You are supposed to use @Controller annotation here.
2. Create a "login.html" as a login page in the templates folder.
3. Add the dependency for thymeleaf in your pom.xml.
4. Change the "filterChain" bean accordingly, implement form-based login through login AP and implement remember me functionality.
5. Test the application using Postman.
